

THE HUMAN BODY AND MICROCURRENTS

The human body functions on electrical impulses. Our nerves carry electrical messages from the brain to muscles to tell them to contract, and hence we get movement. Our nerves carry electrical messages from nerve endings back to the brain and hence we register sensations of sight, taste, touch, smell and sound. Human body cells have a charge of -70-90 mil-volts.

FEEDBACK MECHANISMS

The body functions by consistent monitoring of its internal feedback loops with minute but constant rhythms. The brain can send messages that regulate heart rate, breathing, temperature, reactions to emergencies, etc..

Biofeedback devices and polygraphs (lie detector tests) are well-known and well-recognised similar forms of external bodily monitoring.

It is interesting to note that human cells are 100 times more sensitive to bio-electrical signals than to bio-chemical signals.

STRESSORS

It is well known that our bodies are affected (you might say “stressed”) by

- Ingested allergens (including food and toxins)
- Inhaled allergens (including pollens, mould spores and household dust)
- Synthetic chemicals (in the air, water, clothing, home and medications)
- Inoculations / immunisations
- Radioactivity (natural and man-made) and electromagnetic stress (including that from external electricity wires and household electricity boxes), geopathic stress (including the earth’s magnetic fields, flowing water and strong winds)
- Psycho-social stress (from other people)
- Psychological stress, emotions
- Noise, lack of sleep, overexertion, sedentary life style
- Climate and weather
- Deficiency of essential nutrients
- Infections (bacterial, viral, fungal)
- Inherited stressors – both genetic and *in vivo* (in live tissue)
- Polarity Imbalance.

UNIQUE FREQUENCIES

Scientist Albert Einstein was the first to propose that all substances have a unique frequency. German scientists have been capturing and digitising the frequencies of known stressors and different body tissues since the 1980s.

MONITORING BODY FUNCTION

A polygraph machine and our Body Function Analysis (BFA) machine have a lot in common. Both establish an electrical circuit (or loop) that monitors the body – one via a print-out, the other via a meter.

A polygraph machine detects minute changes in body functions (electrical) when a person tells a lie in response to a question.

Our BFA machine detects minute changes in body functions (electrical) when a control substance or “filter” (or its specific digitised frequency) is introduced into the circuit to see whether the flow of normal bodily electricity is affected. It is like asking the question, “Does thing this affect your body?”

THE BFA MACHINE CIRCUIT

In the BFA machine circuit, control substances can be introduced either physically (by placing them onto its “honeycomb”) or electronically (by switching in their unique frequencies from the thousands of items stored digitally in its memory).

Items stored in the BFA machine’s memory include:

- Heavy metals
- Foods
- Viruses
- Bacteria
- Parasites
- Vaccinations
- Insecticides, herbicides, solvents, gases, preservatives
- Allergies and Medications
- Body tissues
- Polarity Imbalance.

BODY FUNCTION ANALYSIS

Sometimes we just don’t feel well, and can’t explain why. By cross-referencing control substances with the known specific frequencies of body organs and tissues, the BFA machine can suggest a particular area that might have been (or still be) affected by a control substance. For example...

- Lungs / Bacteria
- Brain / Lead / Mercury
- Liver / Flukes
- Sinuses / Allergies / Viruses

TREATMENT

With the results of a Body Function Analysis, you can seek advice from your medical practitioner or a complementary health care professional. Or, if you seek PODR Cellulo-Spiritual balancing as an adjunctive/alternative (if you **are not** currently on Chemotherapy) you can make application to start to begin receiving the Sacrament of PODR.
